

- What was one thing that worked well?
 - Since there are only 2 people in our group, everyone knows his work clearly. It also made the communication very smooth (we almost always responded to each other's messages very quickly). And when we decided on the topic of the project, we quickly decided to do a project on cryptocurrencies, which allowed us to go well at the beginning of the project.

- What was one thing that worked poorly?
 - The bad part of our group project may be the progress of the project. The week before the project slides is due is usually a very busy week, with a lot of other class work due. We didn't take this into account when planning, resulting in us finishing the work the day before project slides due.

- Did you feel like all members of your group contributed to the final project?
 - Yes. Everyone contributed to the project. When doing data visualization, I am mainly responsible for the correlation graph of cryptocurrencies, and Kevin is mainly responsible for the investment direction of cryptocurrencies. When writing the paper, I completed the abstract part of the paper, and Kevin wrote the introduction part. And we write the details of the work we do in related work and discussion respectively
